

Cloud Advisor

 Cloud Advisor

Find your perfect cloud platform in 9 questions

Step 1 of 10

Let's start with your details

Optional

 Cloud Advisor

Find your perfect cloud platform in 9 questions

Step 2 of 10

What will you use the cloud for?

Your main application type

☐  Web app / API

☐  Mobile backend

☒  Data analytics

☐  AI / ML

☐  Business apps

☐  Not sure

Cloud Advisor

Find your perfect cloud platform in 9 questions

Step 3 of 10

Who is this for?

Project scale

☐ Personal / Learning

☒ Startup

☐ Company

☐ Enterprise

Next →

Cloud Advisor

Find your perfect cloud platform in 9 questions

Step 4 of 10

What matters most to you?

Select all that apply

☒ Lowest cost

☒ Easy to manage

☐ AI/ML tools

☐ Microsoft integration

☐ Most services

Find your perfect cloud platform in 9 questions

Step 5 of 10

Monthly budget?

Approximate spending

☐ ₹0-₹1,000

☒ ₹1,000-₹10,000

☐ ₹10,000-₹1,00,000

☐ ₹1,00,000+

☐ ? Not sure

Find your perfect cloud platform in 9 questions

Step 6 of 10

Team's cloud skill?

Existing expertise

☒ AWS

☐ Azure

☐ Google Cloud

☐ Microsoft stack

☐ Beginner

Find your perfect cloud platform in 9 questions

Step 8 of 10

Where are your users?

Geographic location

☒ IN India

☐  Asia-Pacific

☐ EU Europe

☐ US North America

☐  Global

Cloud Advisor

Find your perfect cloud platform in 9 questions

Step 9 of 10

Expected users?

Monthly traffic

☒ <1,000/month

☐ 1K-10K/month

☐ 10K-100K/month

☐ 100K+/month

☐ ? Not sure

Cloud Advisor

Find your perfect cloud platform in 9 questions

Step 10 of 10

Deployment preference?

Technical style

☐ ⚡ Serverless

☐ 📦 Containers

☐ 💻 VMs

☒ 🏢 PaaS

☐ ? Explain these!

← Previous

Get Recommendation 🎯

1.Created the Cloud Advisor Quiz System

- User details (name, email)
- Use case selection (web app, mobile backend, AI/ML, etc.)
- Project scale (personal, small business, enterprise)
- Priorities (cost, ease of use, AI tools, Microsoft integration, services)
- Technical preferences (experience level, existing cloud usage)
- Workload patterns, compliance needs, support requirements
- Budget range

2. Built the Recommendation Engine

Created scoring algorithm in process-recommendation.php:

- AWS, Azure, and GCP get points based on user answers
- Highest score = recommended cloud provider
- Generates personalized explanation of why that provider was chose

3. Set up MySQL Database

- Created cloud_recommendations table to store:
- User responses
- Scores for each cloud provider
- Final recommendation
- Confidence score
- Timestamp

4. Created Results Page

Built result.php that displays:

- Recommended cloud provider with logo
- Confidence score
- Detailed explanation
- Score comparison (AWS vs Azure vs GCP)
- "Start Over" button

5. Made UI

- Emoji icons for visual appeal

How the PHP Scoring Algorithm Works

Step 1: Initialize Scores

For aws, azure, gcp

Step 2: Collect User Input

Get points of usecases, priority, budget

If in Use Case Scoring

User choose web-development we shall assign aws+3 points, azure+3 and gcp+2 points

- If budget is less than \$100/month, GCP gets 3 points (cheapest option)
- If budget is over \$2000/month, AWS and Azure get 4 points (enterprise-ready)

So how we allocate this:

Provider	Score	Reasoning
AWS	+3	AWS has EC2, Lambda, API Gateway - very popular for web apps
Azure	+3	Azure has App Service, Functions - equally good for web apps
GCP	+2	GCP has App Engine, Cloud Run - good, but less popular for traditional web apps

These are real world scenarios.

Similarly for aiml:

Provider	Score	Reasoning
GCP	+5	Google invented TensorFlow! Has Vertex AI, AutoML, TPUs - industry leader
AWS	+3	Has SageMaker, good ML tools, but not as cutting-edge as GCP
Azure	+3	Has Azure ML, decent AI services, but behind Google

Like this for each use case,for each prioritizes the value changes and applies.

The Scale

Score	Meaning
+5	Dominant - This provider is the clear best choice
+3-4	Strong - Very good option
+2	Average - Decent option
+1	Weak - Not ideal
+0	Not relevant - Doesn't apply

How Calculation works:

Your EC2 server (the backend) calculates it using PHP

User Fills Out the Form

The form data is sent via HTTP POST to process-recommendation.php.

The PHP interpreter on EC2 server executes the code

The scores and recommendation are stored in MySQL

PHP redirects the user to result.php

The browser displays the results that were already calculated on the server.

How User Clicks Connect to Scoring

When user clicks:

- Browser marks this radio button as selected
- Value datanalytics is stored temporarily in the form
- NO calculation happens yet! Just storing the choice.

So no calc till recommendation

Clicking recommendation-triggers the data transfer

PHP executes line-by-line and calculates the scores

Why We Chose PHP-PHP is a server-side programming language used to build dynamic websites and web applications.

1. Server-Side Logic

We need to calculate scores on the server (not in browser)
PHP runs on the server and processes data securely
JavaScript (browser) can be manipulated by users - PHP can't!

2. Database Integration

PHP has built-in MySQL support (mysqli, PDO)
Easy to save/retrieve data from database

3. Easy to Learn & Deploy and widely supported

PHP is beginner-friendly
Works with Apache web server (already on your EC2)
No complex setup needed - just upload .php files!

- Server-side security
- Built-in MySQL support
